Individual Report for Excavator Project (Final)

Our group chose Excavator Simulator Training.

I setup the GitHub repository on day 1.

I added the progression system which displays to the trainee how much dirt he/she has collected.

I added the instructions UI.

On April 26, Matthew, Emily, I met and change code together which is all on one commit. This code refined the excavator's size, the dirt size, and the number of dirt.

I created the advertisement PDF and video.

I added Firebase's database to the project. This database stores trainee's sessions and results such as total number of dirt collected, total time trained and number of times trained. The results are viewable on a web portal for the trainer (<http://loganjahnke.com/test/vr/>).

I proof read the research paper.
